Typical applications

- Jacket water temperature
- Compressor discharge temperature
- Steam temperature
- Lube oil temperature
- Process temperature

Model 4075D

Key features and benefits

- 316 Stainless Steel or Cast Aluminum available
- Field adjustable from 54°C to 260°C (130°F to 500°F)
- Reliable protection
- Few moving parts
- Easy installation low maintenance
- Thermowell included
- Compatible with complete AMOT shutdown systems
- Viton seals

Accreditations available

• PED Suitable for Group 1 & 2 liquids (Ensure materials are compatible)

• ATEX (x) II 2G TX X

• **(E** Complies with all relevant EU directives

Overview

The 4075/4475 high temperature valve is used to sense gas or liquid high temperature conditions. The field adjustable temperature setting from 54°C to 260°C (130°F to 500°F) provides wide setpoint flexibility.

The standard thermowell provides extended life of the sensor and simplifies calibration and maintenance.

Operation

The 4075/4475 is widely used for sensing high pressure natural gas compressor discharge temperature. When a valve is positioned at each compressor cylinder discharge manifold, an increase in temperature past the valves set point will cause the valve to vent off a control signal.

Removal is quick and easy with the stainless steel thermowell which is supplied as part of the standard valve assembly. The valve assembly is held into the well by straight thread connections and a locking nut. Unscrewing the valve body/locknut and disconnecting the tubing fittings is all that is required to remove the valve from the well.

The bi-metallic temperature sensing discs arranged in a stack deflect uniformly as the temperature increases providing a long life, low maintenance actuator for the valve spool.

When the temperature of the fluid flowing past the well is below the tripping point, the temperature sensing element assembly is contracted and the loading spring keeps the valve spool in closed position. If the fluid temperature increases, the bi-metallic element assembly expands, moving the valve spool downward (opening valve) against the springs and opening the IN to the VENT port.

Adjustment

Refer to cut-away view on page 8. This model is checked at the factory for proper operation in a still air calibrating oven at approximately 150°C (300°F). To set the unit on the job to suit operating conditions, it should be piped into the safety control systems and be operational.

The master safety control shut off valve should be overridden during adjustments so the machine will continue running.

- 1) First remove cap (4) by pulling upward. It is held in position by a groove in the cap.
- **2)** Gradually lower the setting by holding the flats of rod ③ firmly with a small adjustable wrench, and turning locknut ⑩ clockwise until the safety control indicator registers a trip.
- **3)** Turn locknut ⁽ⁱ⁾ a turn or so counterclockwise, depending on the temperature rise desired for shutdown above the normal operating temperature.

- **4)** One complete turn of the locknut ⁽¹⁾ adjusts the temperature 25 to 35°F. Nut ⁽¹⁾ should be turned sufficiently to effect a bubble-tight seal at the VENT port under normal operating conditions.
- **5)** After adjustment, check to see that the unit operates by manually pushing down on the top of rod ③ (observing the shutdown indicator for that function).
- **6)** If the recommended setting procedure is not possible, setting can be done using a pressure gauge in the VENT port, and turning adjusting nut [®] until the valve cracks open, giving a gauge reading.

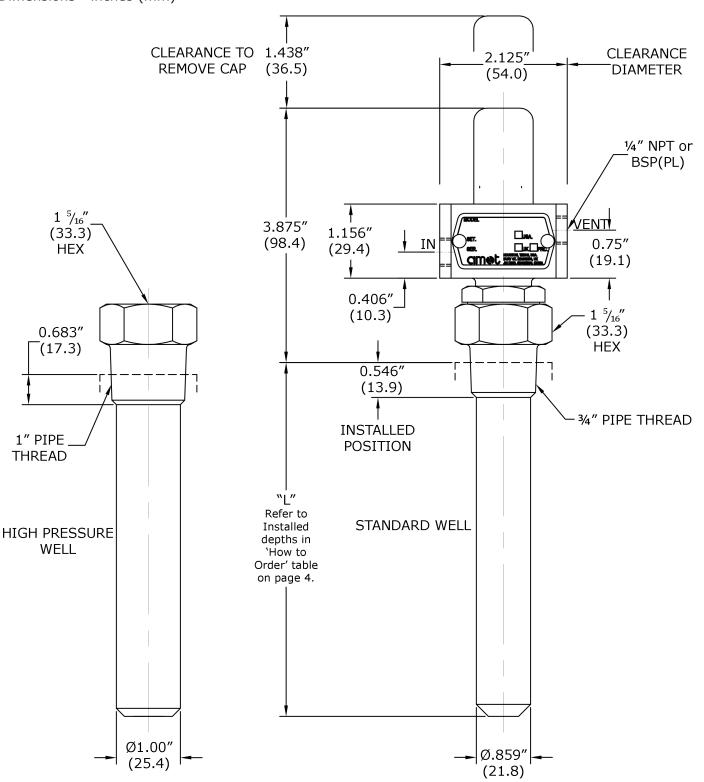

How to Order

Use the table below to select the unique specification of your Model 4075D/4475B High Temperature Valve.

Example	4075D	1	01	-AA	Code description					Comments	
					Model (A)						
Model (A)	4075D				Anodised aluminum

Maintenance and Service Parts

Over time, exposure to foreign chemicals and particulate matter as well as prolonged operation at extreme conditions may reduce the effectiveness of the valve. At such time, AMOT High Temperature Valves can be restored to original performance by replacing the service parts. Service parts for AMOT High Temperature Valves include discs, seals and seal components required for normal maintenance. Please order service parts using the part numbers, quantities and descriptions given in the service parts table below.

AMOT designs and tests all its products to ensure that high quality standards are met. For good product life, carefully follow AMOT's installation and maintenance instructions; failure to do so could result in damage to the equipment being protected or controlled.

AMOT recommends a service interval of 12 months to ensure optimum valve performance.
